

## ABSTRACT

A refuse/oil removing device and a refuse/oil recovery bag are provided which can remove refuse and oil contained in drainage discharged from a restaurant in a simple manner without contact with the refuse and oil.

A support base 46 of support means 40 is disposed in the interior of a grease trap 10 at a position higher than a water level 36b. A recovery bag 42 is attached to the support means 40 and plural layers of bag portions 68a, 68b, and 68c of the recovery bag 42 are put on the support base 46. The bag portions 68a, 68b, and 68c are each formed of a material which permits the adhesion of oil thereto and a large number of water passing holes 72 are formed in each of the bag portions 68a, 68b, and 68c. Drainage is introduced inside the innermost one of the plural layers of bag portions 68a, 68b, and 68c and is passed through the bag portions 68a, 68b, and 68c in this order, allowing refuse and oil to adhere to the bag portions. In this way the work of replacing the recovery bag 42 can be simplified and the amount of oil accumulated within the grease trap 10 can be decreased.
